

CloudFlux Tech — Hostinger Domain + Vercel Deployment Context

Purpose: This document is a handoff/context file for another AI assistant. It contains the current situation, what has already been decided, and the exact workflow needed to connect the purchased Hostinger domain to the existing Vercel deployment.

1. Project / Website Context

Item	Current status / detail
Company	CloudFlux Tech
Domain to use	cloudfluxtech.com
Website	Already deployed on Vercel
Vercel project	cloudflux-tech
Domain registrar	Hostinger
Website hosting	Vercel — no Hostinger hosting needed
Goal	Make https://cloudfluxtech.com live on the existing Vercel website

2. Hostinger Purchase Status

The user was at the Hostinger checkout page for cloudfluxtech.com. The selected period was 1 year. The cart showed domain registration Rs. 2,999, ICANN fee Rs. 55.66, free domain privacy protection Rs. 0, taxes Rs. 0, for a displayed total of Rs. 3,054.66.

Important: Premium Protection with Domain Shield was OFF and should remain OFF unless the user explicitly wants it. It was shown as an additional Rs. 3,588/year. The user does NOT need Hostinger web hosting because the website is already hosted on Vercel.

3. Vercel Screen Already Reached

The user opened the Vercel project 'cloudflux-tech' and opened the 'Add a custom domain' interface. They entered cloudfluxtech.com. Vercel displayed cloudfluxtech.com as a purchasable domain with a price of US\$11.25 and a renewal price of US\$14.50/year.

CRITICAL: Do NOT purchase the domain through Vercel. The intended domain registrar is Hostinger. After buying the domain at Hostinger, the Vercel screen should only be used to ADD/CONNECT the existing domain to the project, not to buy it again.

4. Intended Architecture

GitHub/source code → Vercel deployment/hosting → custom domain DNS managed at Hostinger → <https://cloudfluxtech.com>

Hostinger is only the domain registrar/DNS manager. Vercel is the web host/deployment platform.

5. Exact Post-Purchase Workflow

Step 1: Complete Hostinger purchase of cloudfluxtech.com. Keep Premium Domain Shield OFF. Keep free domain privacy included.

Step 2: Check the Hostinger account/email for any domain/contact verification email and complete verification if requested.

Step 3: Open Vercel → Projects → cloudflux-tech → Settings → Domains.

Step 4: Click Add Domain and enter cloudfluxtech.com. Do not buy it through Vercel.

Step 5: Vercel will show the DNS configuration required for the external domain. Use the exact values shown by the current Vercel dashboard.

Step 6: Open Hostinger → Domains → cloudfluxtech.com → Manage → DNS / DNS Zone.

Step 7: Add/update only the DNS records required by Vercel. Do NOT blindly delete all existing DNS records.

Step 8: If Vercel provides an A record for the apex/root domain, use its exact value. If it provides a CNAME for www, use its exact target. Do not assume values if Vercel shows something different.

Step 9: Save DNS changes. DNS propagation can take time; it may become active quickly but can take up to about 24 hours.

Step 10: Return to Vercel → Settings → Domains and wait for the domain configuration to become valid.

Step 11: Add/configure www.cloudfluxtech.com if desired, and set the preferred primary domain according to the user's preference.

Step 12: Once DNS is correct, test <https://cloudfluxtech.com>. Vercel handles HTTPS/TLS for the custom domain.

6. DNS Safety Rules

- Never delete all DNS records just because Vercel needs an A/CNAME record.
- Do not delete MX records if the user has or later creates domain email that depends on them.
- Only change records that conflict with the Vercel configuration or are explicitly required by Vercel.
- Use the exact current DNS values displayed by Vercel for this project. Avoid guessing.
- If the Hostinger DNS screen contains unfamiliar records, ask for a screenshot before deleting/changing them.

7. Recommended Screenshot-by-Screenshot Assistance

The safest way to continue is to work one screen at a time. After the domain is purchased, ask the user for screenshots of: (1) Hostinger domain overview/management page, (2) Vercel Settings → Domains after adding cloudfluxtech.com, and (3) Hostinger DNS records. Then tell the user exactly which button/field to use and what value to enter. Do not invent DNS values.

8. Final Success Criteria

The setup is complete when the Vercel project recognizes cloudfluxtech.com as a valid custom domain, the website opens at <https://cloudfluxtech.com>, HTTPS works, and the site content is the same as the existing Vercel production deployment.

9. Important Notes for the Next AI

- The user is not asking to create a new website or redeploy the project from scratch.
- The website is already deployed on Vercel.
- The user wants to connect an externally purchased Hostinger .com domain.
- Do not tell the user to buy the domain again through Vercel.
- Do not recommend Hostinger web hosting unless the user's architecture changes.
- When giving DNS instructions, prioritize the exact values shown in the user's Vercel dashboard.
- If the user sends a screenshot, inspect the screenshot and give field-by-field instructions.

End of handoff context. The next AI should continue from the current purchase/connection stage rather than restarting the explanation.
